

NEW

PARARAIL

Patent Pending

Easy and Full Access to Edges of Fall Hazards

The new, Patent Pending ParaRail is a non-penetrating, self-supporting system that allows workers full access to a leading edge on a flat roof or the roof's parapet. ParaRail provides fall protection for a variety of tasks including maintenance for security cameras, antennas, lights, drain cleaning and hoisting of tools and materials. The new system exceeds OSHA Regulations for guardrail (29 CFR 1910.23 and 1923.502).

A new generation component in BlueWater's SafetyRail 2000 Guardrail System, the ParaRail provides the portability and economy of a self-supporting, no drill installation. Like the SafetyRail 2000 Guardrail System, the ParaRail sets-up in just a few minutes. With the EZ Mover (bottom right photo), the bases transport easily. Optional rubber pads are available for added protection of roof membranes when desired.

ParaRail enables users to meet OSHA mandates for leading roof edge safety and fall protection with a mobile system. You can use the ParaRail System as a permanent fixture or move it to different locations. It provides the economies of a fully portable system for commercial, industrial and worksite applications including office building, airports, high-rises, parking decks, raised docks, shopping centers, mezzanines, and bridges.

Each ParaRail is manufactured per application. All we need to know are the lengths for the dimensions that are shown in the diagram below, and the desired length of the span. Powder Coat or galvanized finishes are available.
